WEEK 2

Seatwork 1

Seatwork

Due January 12, 2026 4:30 PM • Closes January 12, 2026 11:59 PM
📅 Prelim Term - Week 2

Instructions

Write a program that are related to checking and displaying eligibility to vote based on age.

Eligibility to Vote:

The program takes an integer age as input and checks if the person is eligible to vote.
It checks if age is greater than or equal to 18.
If the condition is met, the function, it indicates that the person is eligible to vote.
If the condition is not met, it indicates that the person is not eligible to vote.

Printing Eligibility Message:

If the person is eligible to vote, print "You are eligible to vote."
If the person is not eligible to vote, print "You are not eligible to vote."

Codechum Conditions

If Statement

The screenshot shows the CodeChum interface for the problem "Is The Triangle Equilateral?". On the left, the problem description states: "Write a program that takes three integers x, y, and z, as input and checks if they represent the sides of an equilateral triangle. An equilateral triangle has all sides of equal length, so this function checks if x, y, and z are all equal. If they are equal, it prints "triangle is equilateral." Otherwise, it does nothing." Sample Output 1 shows inputs 10, 5, 4 resulting in no output. Sample Output 2 shows inputs 10, 10, 10 resulting in "triangle is equilateral." The central code editor shows a Java solution using an if statement:

```
1: import java.util.Scanner;
2: public class Main {
3:     public static void main(String[] args) {
4:         Scanner sc = new Scanner(System.in);
5:         System.out.print("Enter x: ");
6:         int x = sc.nextInt();
7:         System.out.print("Enter y: ");
8:         int y = sc.nextInt();
9:         System.out.print("Enter z: ");
10:        int z = sc.nextInt();
11:
12:        if ((x == y) && (x == z) && (y == z) && x > 0) {
13:            System.out.print("Triangle is equilateral.");
14:        }
15:    }
16: }
```

 A blue tooltip on the right says: "NEW! Save your code so you'll never lose it even when there's a power interruption or a sudden browser crash. Your code will also be automatically saved once you submit it for checking." The right sidebar shows item navigation (1-5) and test cases (Test case 1, Test case 2).

If else Statement

The screenshot shows the CodeChum interface for the problem "Squaring the Years". On the left, the problem description states: "Write a program that takes two integer inputs, birthYear and currentYear, and calculate the age by subtracting birthYear from currentYear. Then store the calculated age as an integer. The program should then check if the square root of the age is an integer, indicating that it's a perfect square. If it's a perfect square, print "Your age is a perfect square." Otherwise, print "Your age is not a perfect square." Sample Output 1 shows inputs 2000, 2025 resulting in "Your age is a perfect square." The central code editor shows a Java solution using an if-else statement:

```
1: import java.util.Scanner;
2: public class Main {
3:     public static void main(String[] args) {
4:         Scanner scanner = new Scanner(System.in);
5:         int birthYear = 0;
6:         int currentYear = 0;
7:         int age = 0;
8:
9:         System.out.print("Enter your birth year: ");
10:        birthYear = scanner.nextInt();
11:        System.out.print("Enter the current year: ");
12:        currentYear = scanner.nextInt();
13:
14:        age = currentYear - birthYear;
15:        sqrt = (int) Math.sqrt(age);
16:
17:        if (sqrt * sqrt == age) {
18:            System.out.print("Your age is a perfect square.");
19:        } else {
20:            System.out.print("Your age is not a perfect square.");
21:        }
22:    }
23: }
```

 A blue tooltip on the right says: "NEW! Save your code so you'll never lose it even when there's a power interruption or a sudden browser crash. Your code will also be automatically saved once you submit it for checking." The right sidebar shows item navigation (1-5) and test cases (Test case 1, Test case 2).

All or Not

by CodeChum Admin

Write a program that takes three integers, `num1`, `num2`, and `num3`, as input and classifies them based on the following conditions:

- If all three numbers are positive, it prints "All numbers are positive."
- If all three numbers are negative, it prints "All numbers are negative."
- If all three numbers are even, it prints "All numbers are even."
- If all three numbers are odd, it prints "All numbers are odd."
- If none of the above conditions are met, it prints "Numbers are different."

Sample Output 1

Main.java

```
1- import java.util.Scanner;
2- public class Main {
3-     public static void main(String[] args) {
4-         Scanner scanner = new Scanner(System.in);
5-         int num1 = 0;
6-         int num2 = 0;
7-         int num3 = 0;
8-
9-         System.out.print("Enter first number: ");
10-        num1 = scanner.nextInt();
11-        System.out.print("Enter second number: ");
12-        num2 = scanner.nextInt();
13-        System.out.print("Enter third number: ");
14-        num3 = scanner.nextInt();
15-
16-        if (num1 > 0 && num2 > 0 && num3 > 0) {
17-            System.out.print("All numbers are positive.");
18-        } else if (num1 < 0 && num2 < 0 && num3 < 0) {
19-            System.out.print("All numbers are negative.");
20-        } else if (num1 % 2 == 0 && num2 % 2 == 0 && num3 % 2 == 0) {
21-            System.out.print("All numbers are even.");
22-        } else if (num1 % 2 != 0 && num2 % 2 != 0 && num3 % 2 != 0) {
23-            System.out.print("All numbers are odd.");
24-        } else {
25-            System.out.print("Numbers are different.");
26-        }
27-    }
28- }
```

Weather Simulator

by CodeChum Admin

Write a program that takes a character array `weather` as input and prints a weather suggestion based on the first character of the weather condition. Follow these rules:

- If the weather is "Sunny" and the first character of weather is 'S', print "Suggestion: Enjoy the sunshine"
- If the weather is "Cloudy" and the first character of weather is 'C', print "Suggestion: Stay indoors"
- If the weather is "Rainy" and the first character of weather is 'R', print "Suggestion: Bring an umbrella"
- If the weather is "Windy" and first character of weather is 'W', print "Suggestion: Fly a kite"
- For any other value of the first character,

Main.java

```
1- import java.util.Scanner;
2- public class Main {
3-     public static void main(String[] args) {
4-         Scanner s = new Scanner(System.in);
5-         System.out.print("Enter the weather condition: ");
6-         String weather = s.nextLine();
7-         char firstLetter = weather.charAt(0);
8-
9-         switch (firstLetter) {
10-             case 'S':
11-                 System.out.print("Suggestion: Enjoy the sunshine");
12-                 break;
13-             case 'C':
14-                 System.out.print("Suggestion: Stay indoors");
15-                 break;
16-             case 'R':
17-                 System.out.print("Suggestion: Bring an umbrella");
18-                 break;
19-             case 'W':
20-                 System.out.print("Suggestion: Fly a kite");
21-                 break;
22-             default:
23-                 System.out.print("Invalid weather condition.");
24-         }
25-     }
26- }
```
